No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being pri
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  length: 0

Mouse interferon-gamma inducer protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   necrosis factor (TNF), may improve the effect (or reduce side effects) of adoptive immunotherapy in tumours. The DNA encoding this sequence can be used to produce the protein, which can then be purified (or assayed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Protein that induces gamma intecells - used e.g. as antiviral cytotoxicity of killer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                               W15704 standard; peptide; 157
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunocompetent cells. The protein is useful as an antiviral, antiseptic, immunoregulatory and platelet-increasing agent. It can be used for treating or preventing AIDS, condyloma acuminatum, renal or brain cancer, granuloma, mycosis fungoides, rheumatism and allergy. The protein can also be used to induce IFNgamma production in cultured cells. The IFNgamma inducer strongly induces cytotoxicity of killer T-cells and when used with interleukin-2 (IL-2) and tumour
                                                                                                                                                                                      Interferon-gamma, IFN-gamma; antiviral; antioncot
immunoregulatory; antitumour agent; chemotherapy;
thrombocytopaenia; immunocompetent cell; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            using monoclonal antibodies.

When formulated with interleukin-3, it is also used to treat leukopaenia and thrombocytopaenia associated with radiotherapy or chemotherapy of leukaemia and other cancers. When used in antitumour immunotherapy, this novel protein significantly improves the immunotherapeutic effect of interleukin-2 (II-2), compared with use of II-2 alone, either when administered to the patient (before administration of II-2) or by addition to the medium in which cells

CC disease or as an immunosuppressant using anti-IL-18 antibodies which CC can inhibit IL-18. Such antibodies can also be used to detect the IL-18 CC receptor protein (labelled with an enzyme or a radioactive or fluorescent CC substance). The protein is used to treat e.g. graft rejection, pernicious CC anaemia, atrophic gastritis, insulin-resistant diabetes, Wegener CC anaemia, atrophic gastritis, insulin-resistant diabetes, wegener CC cold-agglutinin-relating disease, Goodpasture's syndrome, primary CC cold-agglutinin-relating disease, Soodpasture's syndrome, primary CC biliary cirrhosis, sympathetic ophthalmitis, hyperthyroidism, juvenile CC conset type diabetes, Sjogren syndrome, autoimmune hepatitis, autoimmune CC lique erythematosus, polyleptic cold haemolybinuria, polymyositis, CC periarteritis nodosa, multiple sclerosis, Addison's disease, purpura CC climacterium praecox, rheumatoid arthritis, Theumatopyra, chronic CC climacterium praecox, rheumatoid arthritis, Theumatopyra, chronic CC climacterium praecox, rheumatoid arthritis, altergic constitis, pollinosis, apitoxin-allergy and septic shock resulting from production or administration of excessive gamma interferon (IFN-gamma).
                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT

The IL-18R sequences were isolated from human and mouse. The sequences can be used in drugs for treating IL-18 receptor sensitive disease, especially effective for the relief of rejection accompanied to organ transplantation and for the treatment and the prevention of various organ transplantation and for the treatment and the prevention of various

                                                                                                                                                                                                                                                                                                    and is produced by immunocompetent cells stimulated with antigens or mitogens. A probe derived from the cDNA of the present sequence was used to isolate the corresponding human protein from human liver cells. The protein of the invention is used to treat IFN-gamma susceptible diseases, and also have use as antiviral agent, antibacterial agent, antitumour agent, immunoregulatory agent and blood platelet enhancing agent. Diseases which can be treated with the protein include viral diseases such as candidiasis and malaria; solid malignant tumours such as renal cancer, mycosis fungoides, and chronic granulomatous disease; blood cell malignant tumours such as adult T cell leukaemia, chronic plood cell malignant tumours such as adult T cell leukaemia, chronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        optionally a pharmaceutically acceptable carrier), comprising administering to a mammal afflicted with the tumour cells an effective tumour cell growth inhibiting amount of (I). The II-18 protein in conjunction with a chemotherapeutic agent is useful in a method for preventing and/or treating cancer in mammals by inhibiting the growth of tumours or cancerous cells in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents murine interleukin 18 (IL-18). The present invention describes a compound comprising human or murine IL-18 in combination with a chemotherapeutic agent (I). Also described are: (1) a method of preventing and/or treating cancer in a mammal comprising the administration of a cancer inhibiting amount of (I) comprising the IL-18 protein and the chemotherapeutic agent and optionally a pharmaceutically acceptable carrier; and (2) a method of inhibiting the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Key
Peptide
                                                                                                                      consensus sequences shown in W48956-W48958. The mutant mIGIFs are capable of stimulating immunocompetent cells for the production of interferon-gamma and are claimed to be less toxic, more active and stable than the corresponding wild type mIGIF. The mutant mIGIFs are also claimed to enhance killer cell cytotoxicity and/or induce killer cell formation; and may therefore be useful as antitumour agents, antitumour immunotherapeutics, antiviral agents and antimicrobial agents. The mutant mIGIFs are also claimed to be useful for treating hepatitis,
                                               acquired immunodeficiency syndrome (AIDS), malaria, tuberculosis, malignant tumours (e.g. renal carcinoma), rheumatism, osteoporosi thrombopenia caused by radiation- and chemo-therapy.
                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the wild-type mouse interferon-gamma inducing factor (mIGIF). The invention provides for mutant human and mouse interferon-gamma inducing factors in which one or more cystein
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; pages 38-39; 59pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     factor (mIGIF) sequence is shown in W48960. The invention provides for mutant human and mouse interferon-gamma inducing factors in which one or more cysteine residues are replaced with different residues at or away from the consensus sequences shown in W48956-W48958. The mutant mIGIFs are capable of stimulating immunocompetent cells for the production of interferon-gamma and are claimed to be less toxic, more active and stable than the corresponding wild type mIGIF. The mutant mIGIFs are also
                                                                                                                                                                                                                                                                                                                                                                                                                                             acquired immunodeficiency syndrome (AIDS), malaria, tuberculosis, solimalignant tumours (e.g. renal carcinoma), rheumatism, osteoporosis and thrombopenia caused by radiation- and chemo-therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          claimed to enhance killer cell cytotoxicity and/or induce killer cell formation, and may therefore be useful as antitumour agents, antitumour immunotherapeutics, antiviral agents and antimicrobial agents. The mutant mIGIFs are also claimed to be useful for treating hepatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutants of interferon-gamma inducing antitumour, antiviral, antimicrobial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents the mutant mouse interferon-gamma inducing factor mIGIF/MUT11. The wild-type mouse interferon-gamma factor (mIGIF) sequence is shown in W48960. The invention provide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim
